

BASELINE recorder accuracy on organoid ground-truth lineages

15444 clones from 171 organoids, 5 integrations, neighbour joining, scored against the known clone tree

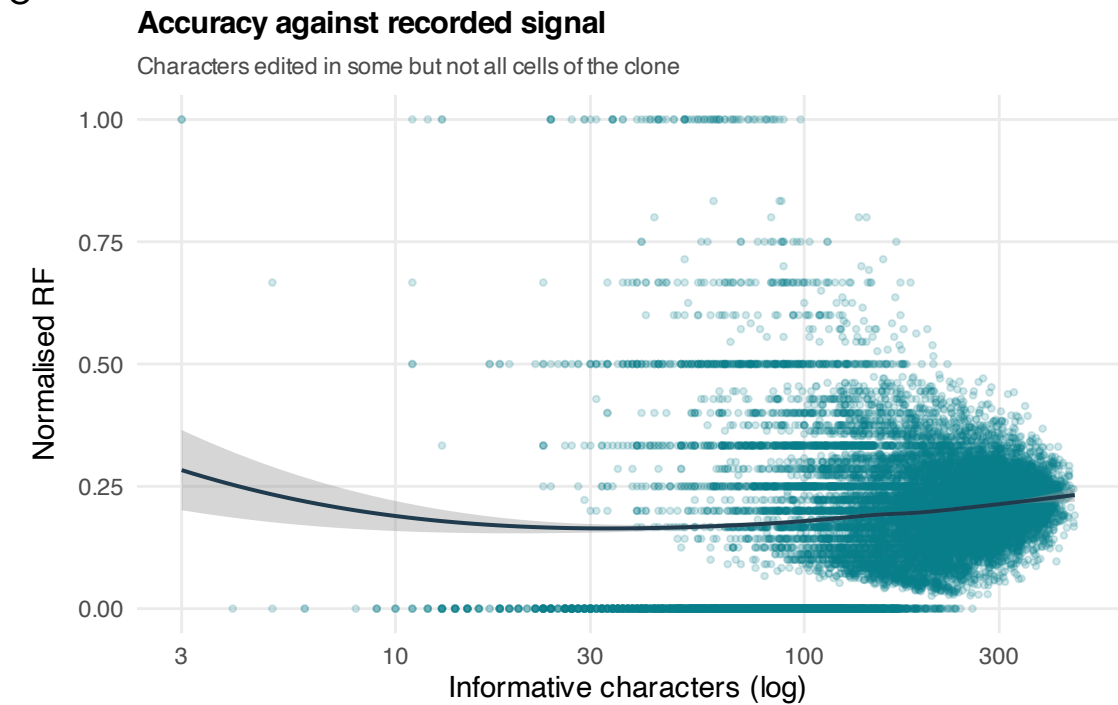

A

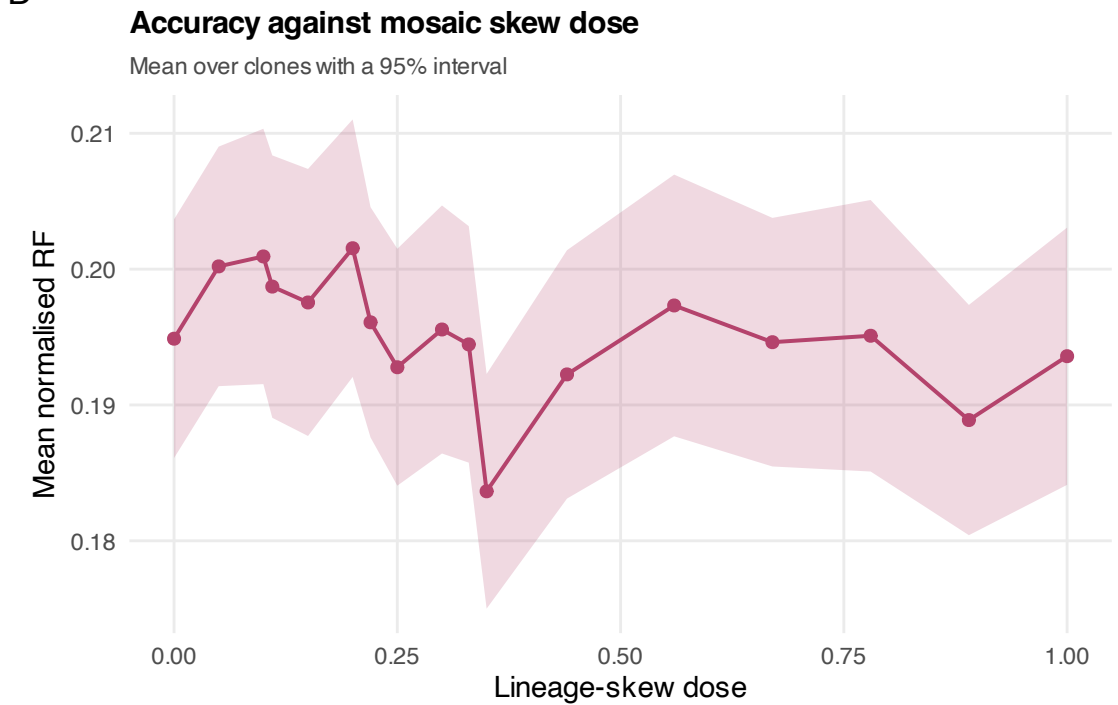

B

C

D

Each clone is reconstructed and scored independently: founders are separate day-zero cells, so a joined organoid tree would score the trivial between-clone splits alongside the within-clone structure at issue. Clones with fewer than four cells are excluded, since an unrooted topology on three tips has no internal split to get wrong.
